

Transit Authority Launches Safety Review After Sensor Reporting Concerns

By Elena Brooks | Public Infrastructure Journal | March 18, 2022

STATE CAPITAL — The State Transit Safety Authority has launched a technical review of optical sensor systems used across several municipal transit networks following concerns about the accuracy and reporting of sensor performance data.

The review covers equipment supplied by technology companies between **2017 and 2021** and will examine whether sensor calibration records were properly maintained and reported to transit authorities.

Officials said the review will focus on three areas: **calibration procedures, maintenance records, and compliance certifications** submitted by equipment suppliers.

According to the authority, companies participating in the review may be required to provide historical engineering records and documentation showing when sensors were tested or recalibrated.

State Transit Safety Commissioner Daniel Hart said the review is intended to improve transparency and establish consistent documentation standards for safety-related telemetry.

The authority emphasized that the review is broader than any single company and that no enforcement action has been announced against companies participating in the review.
